

PDF Text Editor

Built On C, Speed like Jahaz

What this page is

This is a sample document generated for the editor demo. Every line you see is real text in the PDF's own text layer, not a picture of text and not an overlay drawn on top. Turn on Edit, tap a paragraph, and type.

Try these

- ? Edit this paragraph and watch the lines below it reflow to fit.
- ? Edit a heading instead. Headings keep their line, they do not reflow.
- ? Select a word, then delete it. The spacing closes up as it should.
- ? Press Save. What downloads is a real PDF with your edits in its text.

Why it works this way

Most PDF tools cannot change existing text, so they draw a box over it and hope you never open the file anywhere else. This editor rewrites the text objects themselves, then re-renders with the same engine that wrote them, so what you see while editing is what ends up in the saved file.

Engine PDFium, compiled to WebAssembly

Editing one C++ core, shared by web, Android and iOS
